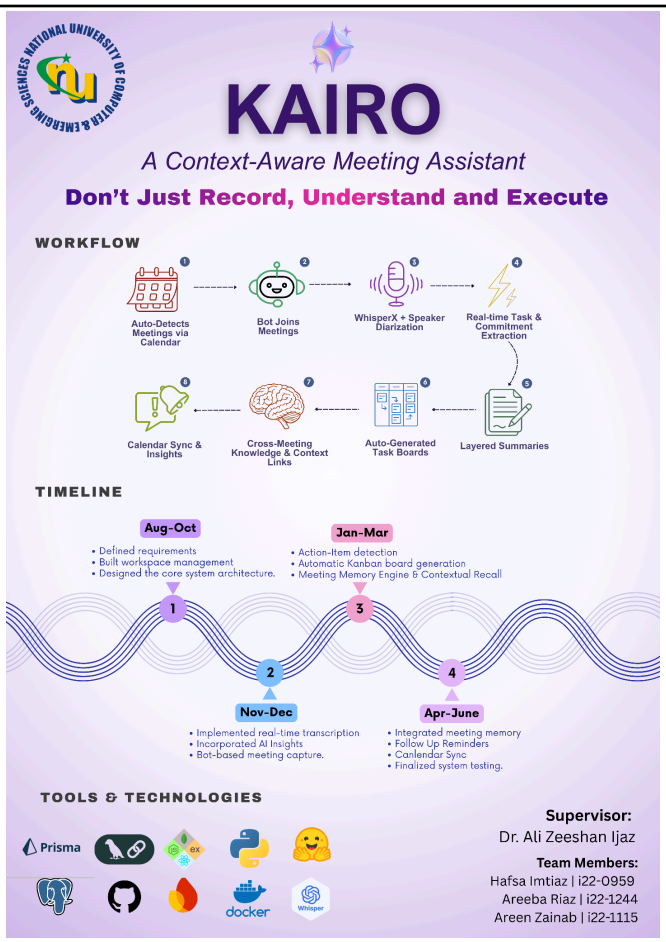
Kairo: Context-Aware Meeting Intelligence

Kairo is an AI-powered context-based meeting intelligence platform designed to enhance how professionals capture, analyze, and extract value from virtual meetings. It provides real-time transcription, speaker identification, AI-driven summarization, automated action item extraction, sentiment analysis, and contextual knowledge management to improve productivity and collaboration. The system is built with a React and TypeScript frontend for user interaction, a Node.js and Express backend for meeting orchestration and API services, and a Python-based AI layer that powers transcription, summarization, sentiment detection, topic identification, and decision extraction.

Features include:

1. The automated meeting bot joins Google Meet and Zoom sessions and provides live transcription with speaker identification and streaming updates.
2. The live AI insights dashboard displays real-time action items during meetings, tracks sentiment and visualizes topics, and generates comprehensive post-meeting reports.
3. The advanced summarization system generates executive, detailed, and structured summaries,
4. The meeting management system stores searchable transcripts, audio recordings, and enables contextual knowledge recall across sessions.
5. Intelligent knowledge graph connects insights, decisions, and action items across meeting history for enhanced contextual recall.

Key Words: WhisperX Speaker Diarization, Puppeteering, WebSocket Real-Time Streaming, Multi-Agent AI Architecture, Semantic Memory



Technology Used:

React, Node.js, PostgreSQL + Prisma, WhisperX, Python, Puppeteer, Tailwind CSS, LangChain, pgVector, Sentence Transformers, WebRTC, Firebase
